Altruism in viscous populations – an inclusive fitness model

P.D. TAYLOR

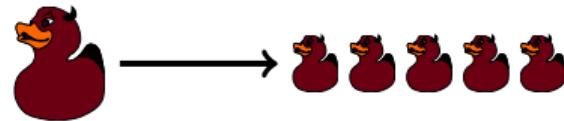

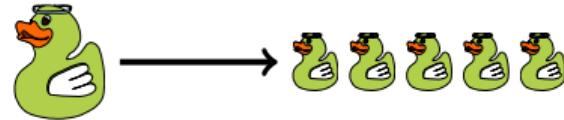

Department of Mathematics and Statistics, Queen's University, Kingston Ont. K7L 3N6, Canada

Summary

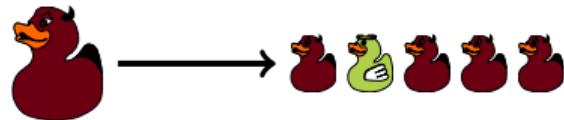

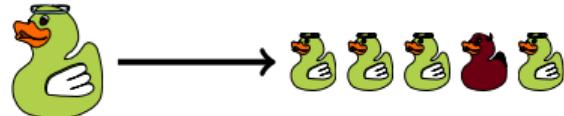

A viscous population (Hamilton, 1964) is one in which the movement of organisms from their place of birth is relatively slow. This viscosity has two important effects: one is that local interactions tend to be among relatives, and the other is that competition for resources tends to be among relatives. The first effect tends to promote and the second to oppose the evolution of altruistic behaviour. In a simulation model of Wilson *et al.* (1992) these two factors appear to exactly balance one another, thus opposing the evolution of local altruistic behaviour. Here I show, with an inclusive fitness model, that the same result holds in a patch-structured population.

Keywords: altruism; inclusive fitness; competition; viscosity

A common feature of models

A common feature of models

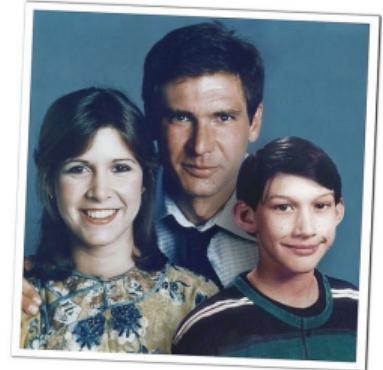

What is the effect of population viscosity
on the evolution of altruism when parent-
offspring strategy transmission is **imperfect**?

Life-cycle
“Death-Birth” updating

Population

$$X_i(t) = \begin{cases} 1 & \text{if site } i \text{ occupied by } \text{🐍 at time } t (1 \leq i \leq N) \\ 0 & \text{if site } i \text{ occupied by } \text{🍅 at time } t (1 \leq i \leq N) \end{cases}$$

Population

$$X_i(t) = \begin{cases} 1 & \text{if site } i \text{ occupied by } \text{green person icon} \text{ at time } t (1 \leq i \leq N) \\ 0 & \text{if site } i \text{ occupied by } \text{red person icon} \text{ at time } t (1 \leq i \leq N) \end{cases}$$

We are interested in $\mathbb{E}[\bar{X}]$,
the expected (\mathbb{E}) proportion (\bar{X}) of altruists in the population.

Social interactions

Social interactions affect fecundity

In a deme with k 

$$f_{\text{green}} = 1 + \omega \left(b \frac{k-1}{n-1} - c \right),$$

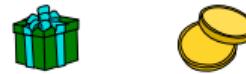

$$f_{\text{red}} = 1 + \omega \left(b \frac{k}{n-1} \right).$$

Social interactions

Social interactions affect fecundity

In a deme with k 

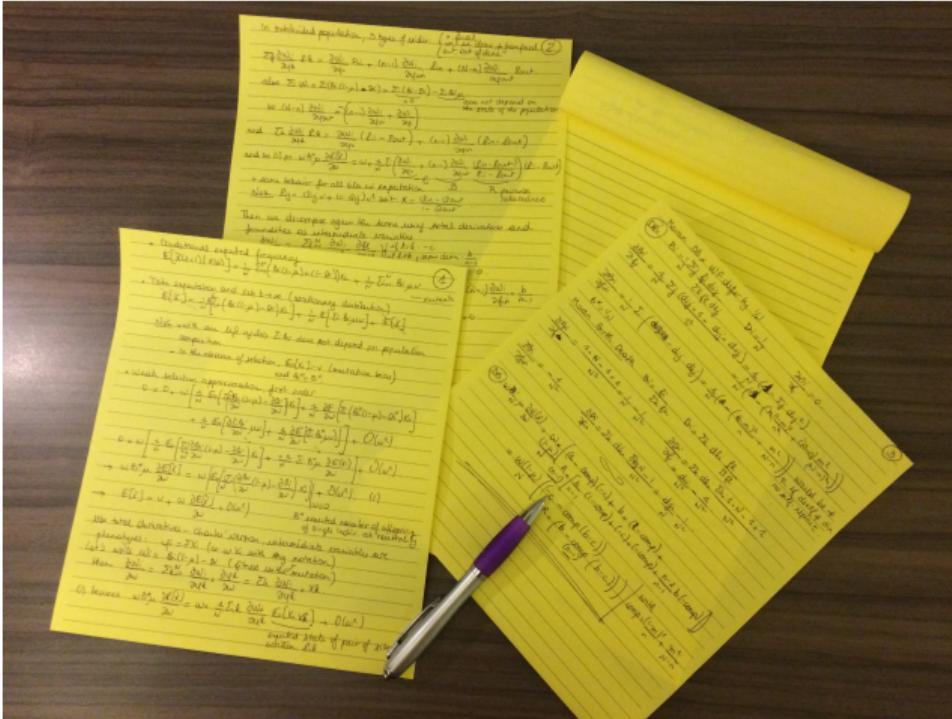

$$f_{\text{green}} = 1 + \omega \left(b \frac{k-1}{n-1} - c \right),$$
$$f_{\text{red}} = 1 + \omega \left(b \frac{k}{n-1} \right).$$

Selection is weak

$$\omega \ll 1.$$
